

Week-5-Practical-2520090183

Task-1

Implement a producer-consumer communication system using anonymous pipes where the parent process generates data and the child process consumes it. Measure the communication efficiency.

```
GNU nano 7.2 producer_consumer.c
#include <stdio.h>
#include <stdlib.h>
#include <unistd.h>
#include <sys/wait.h>
#include <time.h>

int main()
{
    int pipefd[2];
    pid_t pid;
    int data[5] = {10, 20, 30, 40, 50};

    if (pipe(pipefd) == -1)
    {
        perror("pipe failed");
        exit(1);
    }

    pid = fork();

    if (pid < 0)
    {
        perror("fork failed");
        exit(1);
    }

    if (pid > 0)
    {
        // Parent = Producer
        close(pipefd[0]);

        clock_t start = clock();

        printf("Producer (Parent) generating data...\n");

        write(pipefd[1], data, sizeof(data));

        printf("Data sent: ");
        for (int i = 0; i < 5; i++)
            printf("%d ", data[i]);

        printf("%d ", data[i]);
        printf("\n");

        close(pipefd[1]);

        wait(NULL);

        clock_t end = clock();

        double time_taken =
            (double)(end - start) / CLOCKS_PER_SEC;

        printf("Communication time: %f seconds\n", time_taken);

        printf("Producer finished.\n");
    }
    else
    {
        // Child = Consumer
        close(pipefd[1]);

        int received[5];

        read(pipefd[0], received, sizeof(received));

        printf("Consumer (Child) received data: ");

        for (int i = 0; i < 5; i++)
            printf("%d ", received[i]);

        printf("\n");

        close(pipefd[0]);

        exit(0);
    }

    return 0;
}
```

```
root@Priyavallika:~# nano producer_consumer.c
root@Priyavallika:~# gcc producer_consumer.c -o producer_consumer
root@Priyavallika:~# ./producer_consumer
Producer (Parent) generating data...
Data sent: 10 20 30 40 50
Consumer (Child) received data: 10 20 30 40 50
Communication time: 0.000486 seconds
Producer finished.
root@Priyavallika:~# |
```

Observation

The program successfully implemented producer-consumer communication using an anonymous pipe. The parent process generated the data **10, 20, 30, 40, 50** and sent it through the pipe. The child process successfully received and displayed the same data. The communication time was measured as **0.00042 seconds**. The parent used `wait()` to synchronize with the child process.

Result

The producer-consumer communication system was successfully implemented using an anonymous pipe. The data was transferred correctly from the parent process to the child process, and the communication efficiency was successfully measured.

Task-2

Develop a C program that executes the equivalent of the shell command:

ls -l | grep ".c"

```
GNU nano 7.2
#include <stdio.h>
#include <stdlib.h>
#include <unistd.h>
#include <sys/wait.h>

int main()
{
    int pipefd[2];
    pid_t pid1, pid2;

    // Create pipe
    if (pipe(pipefd) == -1)
    {
        perror("pipe");
        exit(1);
    }

    // Create first child
    pid1 = fork();

    if (pid1 == -1)
    {
        perror("fork");
        exit(1);
    }

    if (pid1 == 0)
    {
        // Child 1: execute ls -l

        close(pipefd[0]);

        // Redirect stdout to pipe
        dup2(pipefd[1], STDOUT_FILENO);

        close(pipefd[1]);

        execlp("ls", "ls", "-l", NULL);

        perror("execlp ls");
    }
}
```

using `fork()`, `pipe()`, `dup2()`, and `exec()` system calls.

```

    execlp("ls", "ls", "-l", NULL);

    perror("execlp ls");
    exit(1);
}

// Create second child
pid2 = fork();

if (pid2 == -1)
{
    perror("fork");
    exit(1);
}

if (pid2 == 0)
{
    // Child 2: execute grep ".c"

    close(pipefd[1]);

    // Redirect stdin from pipe
    dup2(pipefd[0], STDIN_FILENO);

    close(pipefd[0]);

    execlp("grep", "grep", ".c", NULL);

    perror("execlp grep");
    exit(1);
}

// Parent closes both ends
close(pipefd[0]);
close(pipefd[1]);

// Wait for both children
waitpid(pid1, NULL, 0);
waitpid(pid2, NULL, 0);

```

```

root@Priyavallika:~# nano pipe_exec.c
root@Priyavallika:~# gcc pipe_exec.c -o pipe_exec
root@Priyavallika:~# ./pipe_exec

-rw-r--r-- 1 root root 580 Aug 28 17:39 zombie.c

```

Observation

The program successfully creates two child processes. The first child executes `ls -l` and sends its output through the pipe. The second child receives this output and executes `grep ".c"` to display matching lines.

Result

The equivalent of the shell command `ls -l | grep ".c"` was successfully implemented using `fork()`, `pipe()`, `dup2()`, and `exec()` system calls in Ubuntu.
